Dear Hiring Manager,

I am a final-year Construction Studies student at the University of the Witwatersrand, and my experience sits across two worlds that do not often meet in the same person. I have worked on active construction sites, supported site managers, contributed to project coordination, and seen first-hand how decisions get made when time, cost, and quality are all in tension at once. I have also worked as a data analyst, building pipelines, validating data, and producing dashboards that turn operational information into something decision-makers can act on. Those two sides of my background are not in conflict. They reinforce each other, and that combination is what I bring to any role I step into.

During my site internships at AZRA Developments and Priotech Projects, I was not observing from a distance. I was involved in coordination, reporting, and tracking the kind of on-the-ground activity that rarely makes it into a spreadsheet but shapes every project outcome. That experience taught me how information flows on a project, where it gets lost, and what it looks like when reporting is done well versus when it is not. When I moved into data analytics work, I brought that operational awareness with me. I know what the people reading a dashboard actually need to see, because I have been in the environment those dashboards are trying to describe.

On the technical side, I have built and delivered end-to-end analytical work independently, under real deadlines, on real business problems. I work across Python, SQL, and Power BI, and I hold the IBM Data Analyst Professional Certificate. I am currently enrolled in a Data Engineering programme at ALX Africa Academy and completing an international data analysis programme through the Rochester Institute of Technology. I document my work properly, version-control everything, and I am honest when something is not working. These are habits I developed because I take the work seriously, not because someone required them.

I have also spent time as a tutor and peer mentor, supporting students through technical concepts and academic transitions. That experience has made me a better communicator than most people with a purely technical background. I know how to read an audience, adapt an explanation, and make sure the point actually lands. In a workplace context, that translates directly into how I present findings, collaborate with teams, and contribute in environments where not everyone speaks the same technical language.

I am looking for a role where the work is meaningful, where rigour is valued, and where my range of experience is an asset rather than a confusion. Whether the role sits closer to site management, data analytics, business intelligence, or somewhere in between, I am confident I can contribute from day one and grow well beyond it.

My CV is attached and my project work is available at the portfolio link above. I would welcome the opportunity to speak with your team.

Yours sincerely,

Baxolele Mazwi
